# Buzzing Around

Have you ever watched a bee fly? You may have seen bees buzzing around plants and flowers. Did you wonder what the bees were doing?

You may think bees fly around so they can sting people. But that is not true. Bees will only sting if they are scared or bothered.

Honeybees would rather do their jobs than sting people. Their jobs are very important.

bee hive

# The Lives of Honeybees

One job that honeybees have is to build their homes. But they do not have to do it alone. Honeybees live in big groups called **colonies**. Colonies work together to build their homes. These homes are called hives. Most of the time, bees build their hives in trees.

The honey that people buy in stores comes from bee farms. The bees on farms do not build their hives in trees like wild honeybees do. The bees on farms live in big boxes that are used as their hives.

Bees on farms use boxes like these as their hives.

## LET'S EXPLORE MATH

Look at the picture below. Find the number of honeybees.

Which of the following show the number of bees in the picture?

- A. 
- B. 
- C. 

Honeybees have another job. They make honey from nectar. Nectar is a sweet juice found in flowers. Bees love the taste. They spend their days searching for nectar. One bee may drink nectar from hundreds and hundreds of flowers each day!

Honeybees use their long tongues to drink nectar from flowers. When they drink their fill, they go back to their hives. Once there, they spit into other bees' mouths. These bees chew the nectar for about 30 minutes. Then, they spit it into the honeycomb part of the hive.

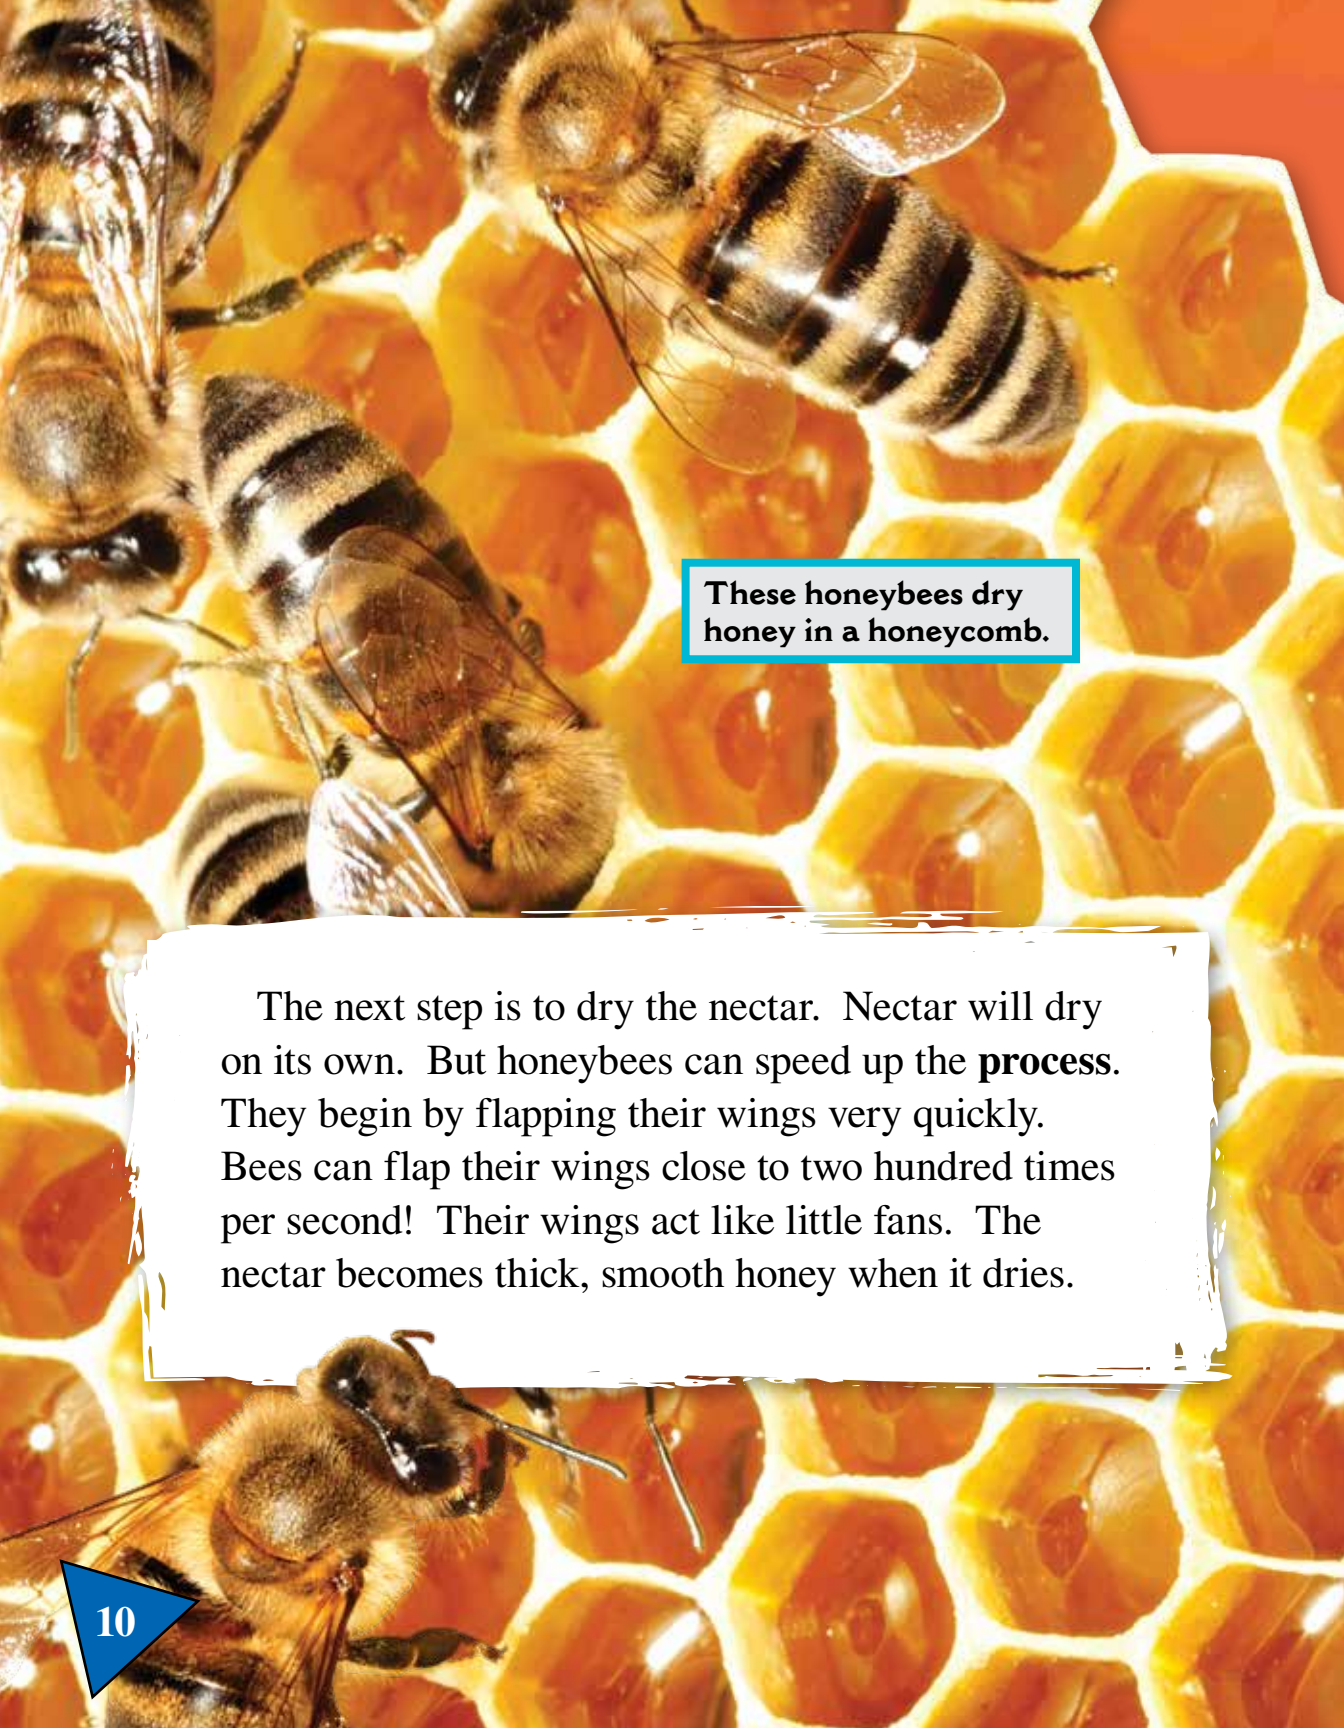

bees in a honeycomb

A honeybee uses its tongue to suck up nectar from flowers.

A close-up photograph of several honeybees on a honeycomb. The bees are brown and black with fuzzy bodies and transparent wings. The honeycomb consists of many hexagonal cells, some of which are filled with a golden, viscous substance (nectar or honey). The background is a solid orange color.

These honeybees dry  
honey in a honeycomb.

The next step is to dry the nectar. Nectar will dry on its own. But honeybees can speed up the **process**. They begin by flapping their wings very quickly. Bees can flap their wings close to two hundred times per second! Their wings act like little fans. The nectar becomes thick, smooth honey when it dries.

## LET'S EXPLORE MATH

Honeybees can flap their wings close to two hundred times each second. Which of the following shows the number closest to two hundred?

# Helping Plants

Honeybees make honey that people eat. But that is not all they do. Bees help flowers, too. Flowers have a dust called pollen. It sticks to bees when they land. Bees move pollen from flower to flower when they drink nectar. This process is called **pollination**. It helps flowers make seeds to grow new plants.

This bee is covered in pollen.

# LET'S EXPLORE MATH

There are 10 fruit trees. Each tree has 10 honeybees drinking nectar from its flowers.

- Which of these shows the number of bees on 1 tree?

A.

B.

C.

- Which of these shows the number of bees on all the fruit trees?

A.

B.

C.

# Bees in Danger

Honeybees help plants and animals. Many animals eat the plants that bees help grow. These animals **depend** on bees. Without bees, their lives would change.

But bees are in danger. They are dying from **chemicals** that are used to kill bugs. Farmers want to keep bugs from eating their **crops**. The chemicals they spray to kill those bugs can hurt bees, too.

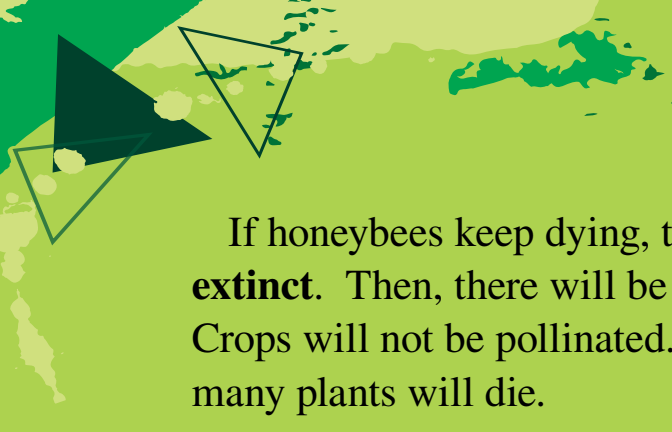

**Bees pollinate many crops,  
including lemon trees.**

**Two farmers spray chemicals  
on plants to kill bugs.**

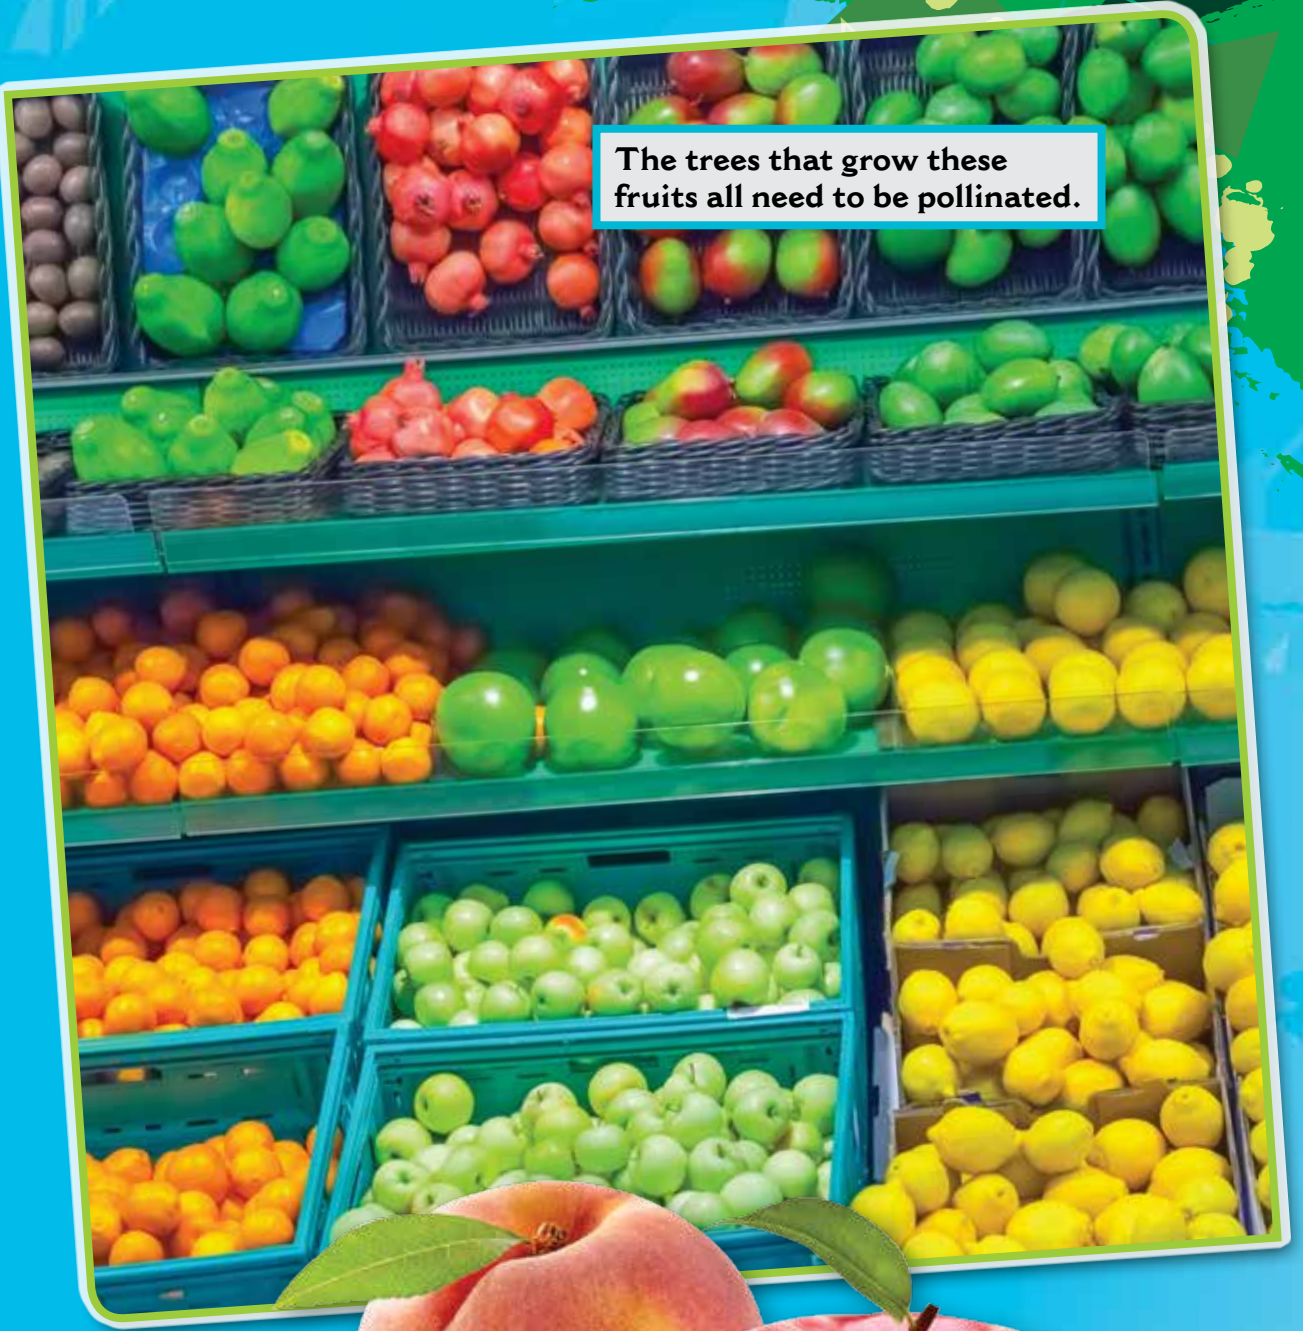

If honeybees keep dying, they may become **extinct**. Then, there will be no more honey. Crops will not be pollinated. Without bees, many plants will die.

Fruit and nut trees will not grow foods for us to eat. There will be no more almonds. Apples and peaches will stop growing, too. People will not get to eat many of the foods they love.

Two boys enjoy fruit.

The trees that grow these  
fruits all need to be pollinated.

# Our World in Danger

Honeybees **affect** many things around them. Bees are small insects. But they play a big role in Earth's **food chain**.

Without bees, **creatures** such as squirrels and mice will not have berries and seeds for food. These small animals will die without food.

## LET'S EXPLORE MATH

1. There are  $100 + 40 + 6$  mice eating berries in a field. Write one number to show how many mice there are.
2. In the same field, there are 192 squirrels eating acorns. Write 192 as a total of hundreds, tens, and ones.

A circular inset image showing a honeybee with its legs and wings spread, sitting on the yellow stamens of a white flower. The background is a soft-focus green.

**A honeybee carries pollen  
from one plant to another.**

A circular inset image showing a cluster of blackberries. Some are dark purple-black, while others are still red, indicating they are ripening. The berries are surrounded by green leaves.

**Berries grow when the  
plant has been pollinated.**

A circular inset image showing a brown mouse with its mouth open, eating a blackberry. The mouse is sitting on a piece of wood, and some berry seeds are visible.

**A mouse eats  
the berries.**

Small animals are food for large animals. Many large animals, such as owls and foxes, eat small animals, such as mice and squirrels. Large creatures will die without food to eat.

Bees affect many other creatures in our world. Without bees, our lives will change. Many plants will not grow. Lots of animals will die.

**Foxes and owls eat mice.**

A mouse eats berries.

# Save the Bees

Bees are dying around the world, but you can help save them. Start by planting flowers that bees like. These flowers will give bees nectar.

Be sure to plant flowers that will bloom at different times of the year. That way, bees will always be able to get nectar. Bees get a lot of nectar from weeds, such as clovers. Weeds can cause other problems. But bees need them.

clover

A close-up photograph of a honeybee on a clover flower. The bee is positioned diagonally, facing towards the bottom right. Its body is covered in fine hairs, and its wings are partially spread. The bee's head is lowered into the center of the flower, where it is drinking nectar. The flower is a cluster of small, light pinkish-white blossoms. The background is a soft, out-of-focus green, suggesting foliage. In the top right corner, there is a decorative graphic consisting of overlapping orange and yellow geometric shapes. A blue rectangular box with a thin white border is located in the upper left quadrant, containing the text "A honeybee drinks nectar from a clover." In the bottom right corner, there is an orange triangle containing the number "23".

**A honeybee drinks  
nectar from a clover.**

You can also help bees by not spraying chemicals on plants. Chemicals make bees sick. If you have bees in your yard, have an adult call a beekeeper. Beekeepers are trained to work with bees. They can get them out of your yard. Then, they can move the hive to a safe place.

**A beekeeper moves a hive on a bee farm.**

**Large hives can have more than 50,000 honeybees.**

# Will You Help?

Honeybees have many big jobs. They make honey for people to eat, and they help plants grow. They help make food for many animals, too.

We will all be in trouble without honeybees. Our lives will change. But small changes can help save them. Start helping bees today. It is up to all of us to keep bees safe.

These people want farmers to stop using chemicals on crops.

# Problem Solving

José and Makayla have bees on their farm. First, the bees make honey. Then, they sell the honey.

1. José and Makayla have 52 hive boxes. Which of the following show 52?

2. José and Makayla add 8 more hive boxes. How many hive boxes do they have now? How do you know?
3. The bees on the farm make 108 pounds of honey in a month.
- a. Write 108 as a total of hundreds, tens, and ones.
  - b. Draw the number line below, and plot 108.

# Glossary

**affect**—act on a person or thing and cause it to change

**chemicals**—things that are made when two or more substances are mixed together

**colonies**—groups of similar people or things living in one place

**creatures**—types of animals

**crops**—groups of plants grown by farmers

**depend**—need or to count on someone or something

**extinct**—no longer existing in the world

**food chain**—a chain of events in which one type of living thing is food for another type of living thing

**pollination**—the act of moving pollen from one plant to another

**process**—a series of actions that produce something or make something happen

# Answer Key

## Let's Explore Math

page 7:

B and C

page 11:

A

page 13:

1. A and C
2. B

page 18:

1. 146 mice
2.  $100 + 90 + 2$

## Problem Solving

1. A and D
2. 60 hive boxes; Answers will vary but may include  $52 + 8 = 60$ .
3. a.  $100 + 0 + 8$

# Math Talk

1. One beekeeper places 10 honeybees in each of his 10 hives. Another beekeeper places 100 honeybees in 1 hive. Who has more total honeybees? How do you know?
2. Are 20 tens the same as 200? How do you know?
3. How can you build a model of 900 using only tens blocks?
4. Is it possible to build a model of 235 using only hundreds blocks? Why or why not?
5. Stacy says she can make \$300 with 30 ten-dollar bills. Seth says he can make \$300 with 20 ten-dollar bills and 100 one-dollar bills. Do you agree with either of them? Why?
6. How many ways can you arrange the digits 3, 6, and 9 to create three-digit numbers? How can you use hundreds, tens, and ones to prove that each number is different?
